

CANDY WARNING

Halloween candy may be contaminated with **MELAMINE**, a poisonous chemical that causes kidney failure, liver failure and death. This poison has been found in Halloween chocolates and candies made in China, where Melamine has already sickened over 50,000 babies due to infant formula contamination.

Retailers in the U.S. are **STILL SELLING** candy contaminated with Melamine. The US Food and Drug Administration has done nothing to protect American families from this toxic chemical. This is the same chemical that killed tens of thousands of dogs earlier in 2008 when pet food was found to be contaminated with it. The dogs died from liver failure.

It is very possible that the candy being handed to your children tonight is **CONTAMINATED WITH MELAMINE**.
Google "Melamine" to learn more.

THIS IS NOT A HOAX. Children across the country may soon find themselves poisoned with low doses of melamine. Although low doses may not be fatal, they persist in the body and may sicken children for days, weeks or months. Do not allow your children to eat Halloween candy made in China. If you are unsure of the origin of the candy, throw it out.

Because of this very serious melamine contamination issue, we have decided
NOT TO GIVE OUT HALLOWEEN CANDY this year.

PROTECT YOUR CHILDREN. Do not let them eat Halloween candy this year.
